

Delivers centimeter level accuracy within seconds based on U-blox ZED-F9P L1/L2 GNSS module

Datasheet - In Production

Description

The DP0601 GNSS RTK F9P is an affordable compact and high precision L1/L2 GNSS RTK device.

Based on the last generation of GNSS U-blox ZED-F9P modules, the DP0601 offers reliable and fast convergence time to provide centimeter accuracy within seconds.

The device allows concurrent reception of GPS / GLONASS / BeiDou & Galileo signals to improve signal availability.

The JST-GH connectors make them perfect to be connected to a Pixhawk3Pro or any other autopilot.

The DP0601 GNSS RTK is guaranteed to operate over a temperature range of -20°C to +70°C.

Features

- 5V - 100mA power supply
- LEDs status : Timepulse/Power/RTK
- Timepulse & External Interrupt
- USB/I²C/SPI/UART digital interfaces
- Gold plated SMA connector
- ESD protection diodes

Applications

- Drones
- RTK Base
- Ground vehicles
- Precise navigation
- Automation of moving machinery

3. Absolute maximum ratings

Stresses above those listed as “absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 7. DP0601 absolute maximum ratings

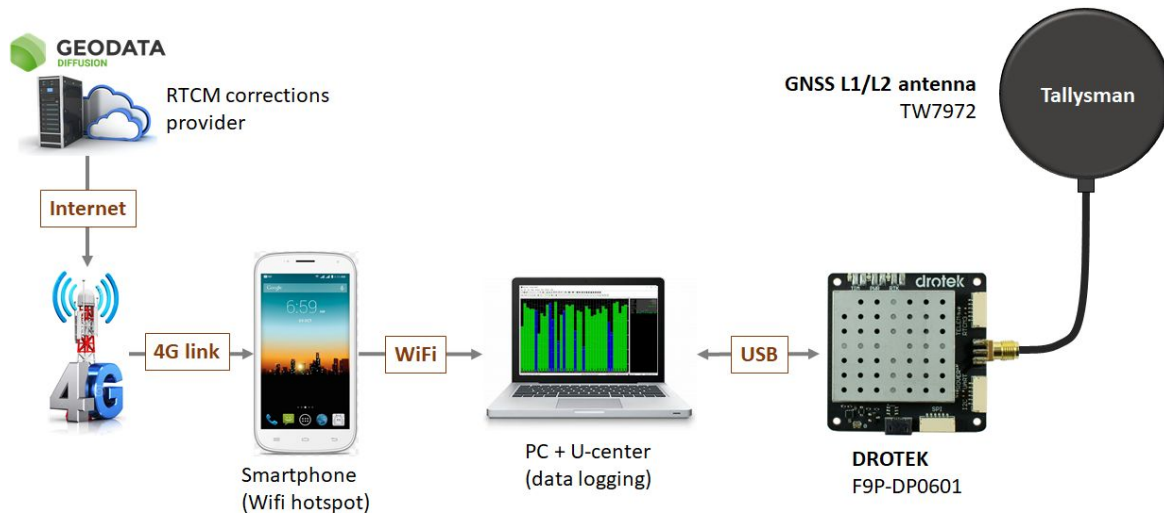

Symbol	Parameter	Maximum value	Unit
Vusb	USB supply voltage	-0.3 to +6	V
Vdd	Internal supply voltage	-0.5 to +3.6	V
Vdd_IO	I/O pins supply voltage	-0.5 to Vdd+0.5	V

Prfin	Input power at RF_IN	10	dBm
TOP	Operating temperature	-40 to +80	°C
TSTG	Storage temperature	-40 to +80	°C

This device is sensitive to electrostatic discharge (ESD), improper handling can cause permanent damage to the part.

5. Communication interfaces

There are several communications interfaces including UART, SPI, I2C11 and USB. All the inputs have internal pull-up resistors in normal operation and can be left open if not used. All the PIOs are supplied by VCC, therefore all the voltage levels of the PIO pins are related to Vdd supply voltage.

5.1 UART Interface

There are two UART interfaces: UART1 and UART2. UART1 and UART2 operate up to and including a speed of 921600 baud. No hardware flow control on UART1 and UART2 is supported. UART1 is enabled by default if there is no 5V input voltage on pin A1 (5V SPI).

Figure 6. UART chronogram specifications

Table 8. DP0601 serial UART timing specifications

Symbol	Parameter	Min.	Max.	Unit
V _{il}	LOW-LEVEL input voltage	0	0.2xVdd	V
V _{ih}	HIGH-LEVEL input voltage	0.7xVdd	Vdd+0.3	V
t _{EH}	HIGH period of external data input	0	0.4	μs
t _{EL}	LOW period of external data input	TBA	TBA	μs
R _u	Baudrate	9600	921600	bps
t _{CR}	Rise time of data		5	ns
t _{CF}	Fall time of data		5	ns

5.2 SPI interface

The DP0601 has an SPI slave interface that can be selected by supplying a 5V voltage on pin A1 (5V SPI). The SPI slave interface is shared with UART1. The SPI pins available are: SPI_MISO (TXD), SPI_MOSI (RXD), SPI_CS_N, SPI_CLK. The SPI interface is designed to allow communication to a host CPU. The interface can be operated in slave mode only. Note that SPI is not available in the default configuration because its pins are shared with the UART and I2C interfaces. The maximum transfer rate using SPI is 125 kB/s and the maximum SPI clock frequency is 5.5 MHz.

This section provides SPI timing values for the ZED-F9P slave operation. The following tables present timing values under different capacitive loading conditions. Default SPI configuration is CPOL = 0 and CPHA = 0.

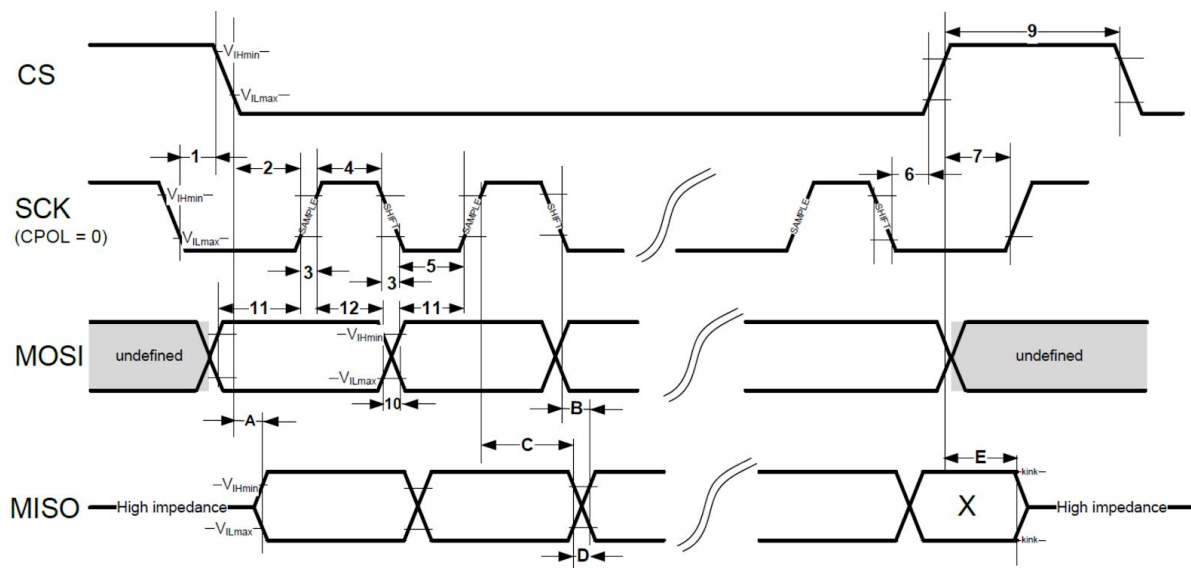

Table 9. DP0601 SPI timing specifications

Timing value @ 20pF load	Min [ns]	Max [ns]
"A" - MISO data valid time (CS)	19	52
"B" - MISO data valid time (SCK) weak driver mode	25	51
"C" - MISO data hold time	117	137
"D" - MISO rise/fall time, weak driver mode	6	16
"E" - MISO data disable lag time	20	32

5.3 Slave I2C interface

An I2C compliant interface is available for communication with an external host CPU. The interface can be operated in slave mode only. It is fully compatible with Fast-Mode of the I2C industry standard. Since the maximum SCL clock frequency is 400 kHz, the maximum bit rate is 400 kbit/s. The interface stretches the clock when slowed down while serving interrupts, therefore the real bit rates may be slightly lower.

Note : The I2C interface is only available with the UART default mode. If the SPI interface is selected by supplying a 5V onto the A1 pin (5V SPI), the I2C is not available.

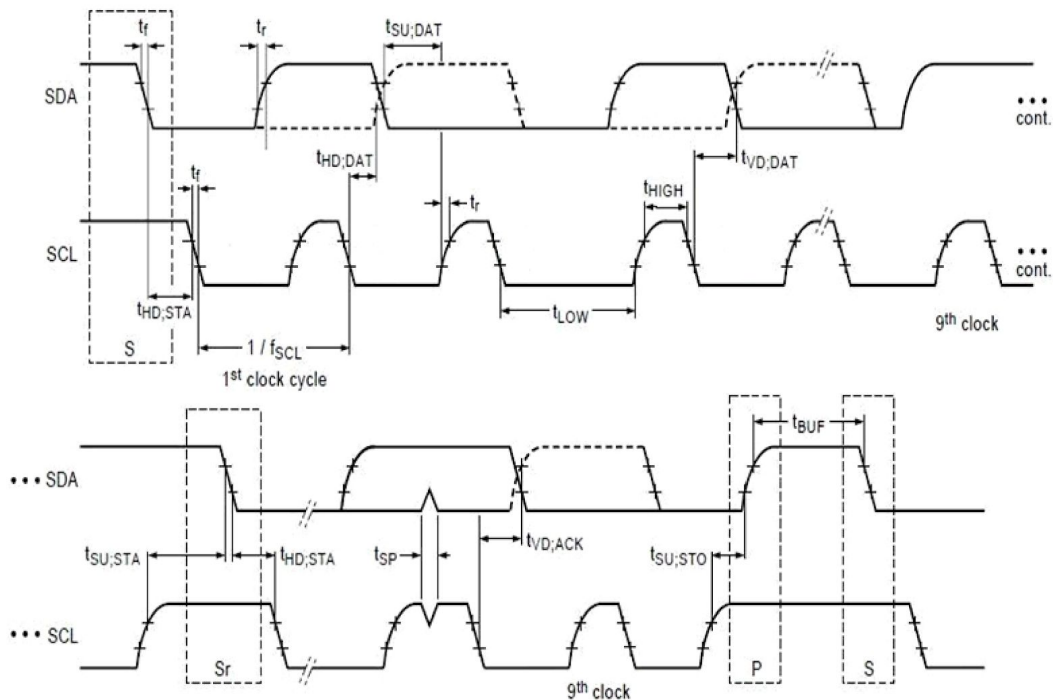

Table 10. DP0601 I2C timing specifications

Symbol	Parameter	Min	Max	Unit
Vil	LOW-LEVEL input voltage	Vss-0.3	0.3xVdd	V
Vih	HIGH-LEVEL input voltage	0.7xVdd	Vdd+0.3	V
Vol	LOW-LEVEL output voltage		0.4	V
Voh	HIGH-LEVEL output voltage	Vdd-0.4		V
Fscl	SCL clock frequency	0	400	KHz

5.4 USB interface

A USB interface, which is compatible to USB version 2.0 FS (Full Speed, 12 Mbit/s), can be used for communication as an alternative to the UART.
